## Supplementary Information

for:

An abiotic, tetrameric, eight-helix bundle

Friedericke S. Menke, Barbara Wicher, Lars Allmendinger, Victor Maurizot and Ivan Huc
Supplementary Information ..... 1
1 List of Abbreviations .....  3
2 Supplementary figures ..... 4
3 Supplementary methods ..... 35
3.1 HRMS analyses ..... 35
3.2 Molecular modelling ..... 35
3.3 Nuclear magnetic resonance spectroscopy ..... 36
3.4 CD studies ..... 37
3.5 X-ray crystallography ..... 37
4 Synthetic Schemes ..... 41
4.1 Synthesis of sequences to test handedness-induction via chiral B-unit ..... 41
4.2 Synthesis of helix-turn-helix-motif with a flexible linker and handedness-control in both helices via a chiral B-unit ..... 42
4.3 Synthesis of helix-turn-helix-motif with a flexible linker and handedness-control in one helix ..... 43
4.4 Synthesis of helix-turn-helix-motif with a flexible linker and without any handedness-control ..... 14
5 Experimental Procedures ..... 45
5.1 General methods ..... 45
5.2 Solid phase synthesis general methods ..... 45
6.3.1 Loading of the resin via HBTU-coupling ..... 45
6.3.2 Estimation of the loading ..... 45
6.3.3 Solid Phase Synthesis via in-situ-activation ..... 46
6.3.4 Mini Cleavage ..... 46
6.2.3 Full Cleavage ..... 47
5.3 Synthesis of oligomers ..... 47
6.3.1 Synthesis of sequences to test handedness-induction via chiral B-unit ..... 47
5.3.2 Synthesis of sequences with a helix-turn-helix-motif and handedness-control in both helices ..... 51
5.3.3 Synthesis of sequences with a helix-turn-helix-motif and handedness-control in one helix ..... 56
5.3.4 Synthesis of achiral sequences with a helix-turn-helix-motif ..... 61
6 References ..... 64
7 NMR spectra of new compounds ..... 65
7.1 Sequences to test handedness-induction via chiral B-unit ..... 65
7.2 Sequences with a helix-turn-helix-motif and handedness-control in both helices ..... 75
7.3 Sequences with a helix-turn-helix-motif and handedness-control in one helix ..... 87
7.4 Achiral sequences with a helix-turn-helix-motif ..... 96

## 1 List of Abbreviations

CD $\rightarrow$ circular dichroism
DCM $\rightarrow$ dichloromethane
DIPEA $\rightarrow \mathrm{N}, \mathrm{N}$-diisopropylethylamine
DMF $\rightarrow \mathrm{N}, \mathrm{N}$-dimethylformamide
DOSY $\rightarrow$ diffusion-ordered spectroscopy
ESI $\rightarrow$ electrospray ionization
EtOAc $\rightarrow$ ethylacetate
eq $\rightarrow$ equivalent
Fmoc $\rightarrow$ fluorenylmethoxycarbonyl
HBTU $\rightarrow$ Hexafluorophosphate Benzotriazole Tetramethyl Uronium
Hex $\rightarrow$ Hexane
HFIP $\rightarrow$ hexafluroisopropanol
HR-ESI $\rightarrow$ high-resolution electrospray ionization
HRMS $\rightarrow$ high-resolution mass spectrometry
HSQC $\rightarrow$ heteronuclear single quantum correlation
$\mathrm{MeOH} \rightarrow$ methanol
$\min \rightarrow$ minutes
MS $\rightarrow$ mass spectrometry
MW $\rightarrow$ microwave
NMR $\rightarrow$ nuclear magnetic resonance
r. t. $\rightarrow$ room temperature

SPS $\rightarrow$ solid phase synthesis
TFA $\rightarrow$ trifluoroacetic acid
THF $\rightarrow$ tetrahydrofuran
UV/Vis $\rightarrow$ ultraviolet-visible

## 2 Supplementary Figures

a) $P P$ parallel dimer - helix-turn-helix fold

b) PM parallel dimer - helix-turn-helix fold

c) $P P / M M$ \& $P M$ shifted dimer

d) PP/MM clockwise tilted dimer

e) PP/MM counterclockwise tilted dimer

f) $P M$ clockwise tilted dimer

g) $P M$ counterclockwise tilted dimer

Figure S1. Schematic representation of hydrogen-bonding interfaces of previously described and hypothetical self-organizations. a) and b) Hydrogen bonding interfaces as characterized in a $P P / M M$ (a) and $P M$ (b) parallel dimer, as observed in helix-turn-helix tertiary structures stabilized by a T1 or T2 turn unit, respectively. ${ }^{1-3}$ c) Hydrogen bonding interface as observed in $P P / M M$ and $P M$ shifted dimers. ${ }^{4}$ d) and e) Hydrogen bonding interfaces observed in $P P / M M$ clockwise (d) and counterclockwise (e) tilted dimers. ${ }^{1}$ f) and g) Hypothetical hydrogen bonding interfaces in PM clockwise (f) and counterclockwise (g) tilted dimers.

Figure S2. Sequences $4-8$ show one set of ${ }^{1} \mathrm{H}$ NMR signals in $\mathrm{CDCl}_{3}$. Extracts of ${ }^{1} \mathrm{H} N \mathrm{NR}$ spectra $(500 \mathrm{MHz}$, $25^{\circ} \mathrm{C}$ ) of $4-8$ in $\mathrm{CDCl}_{3}$ at 2.4 mM showing the amide region. Different color of the ${ }^{1} \mathrm{H}$ NMR signals indicate the presence of a different level of handedness-control: Achiral sequences are marked in turquoise, sequences at which one unit controls handedness are marked in brown and sequences at which two units are inducing handedness control are marked in gold.

Figure S3. Sequences $4-8$ show one set of ${ }^{1} \mathrm{H} N M R$ signals in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$. Extracts of ${ }^{1} \mathrm{H} N \mathrm{NR}$ spectra ( 500 MHz , $25^{\circ} \mathrm{C}$ ) of $4-8$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ at 2.4 mM showing the amide region. Different color of the ${ }^{1} \mathrm{H}$ NMR signals indicate the presence of a different level of handedness-control: Achiral sequences are marked in turquoise, sequences at which one unit controls handedness are marked in brown and sequences at which two units are inducing handedness control are marked in gold.

Figure S4. The chiral B unit biases helix handedness quantitatively and overcomes the opposing effect of a camphanyl group. CD spectra of $4-8$ in $\mathrm{CHCl}_{3}(\mathrm{a})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (b) between 250 and 500 nm at $25{ }^{\circ} \mathrm{C}$. The molar extinction $(\Delta \varepsilon)$ is normalized for the number of $Q$ units for better comparability.

Figure S5. Energy minimized models ${ }^{5}$ of $P M$ shifted dimers ${ }^{4}$ connected by flexible linkers of different lengths, showing hydroxy groups not involved in hydrogen bonding. Top view of a computational model ${ }^{5}$ of a $P M$ shifted dimer ${ }^{4}$ containing a flexible linker unit with a flexible peg2 (a), peg3 (b) and peg4 (c) backbone, respectively. Side view of a computational model ${ }^{5}$ of a $P M$ shifted dimer ${ }^{4}$ containing a flexible linker unit with a flexible peg2 (d), peg3 (e) and peg4 (f) backbone, respectively. Purple and blue helices represent $M$ - and $P$ handedness, respectively. The hydroxyl protons and carbonyl oxygen atoms of the hydrogen-bonding arrays are shown as yellow and red balls. The flexible linker is shown in green. Hydrogen and other side-chains are omitted for clarity. The linker amide bond is turned out of the plane (marked in light green) in (d).

Figure S6. Energy minimized models ${ }^{5}$ of $P P$ shifted dimers ${ }^{4}$ connected by flexible linkers of different lengths, showing hydroxy groups not involved in hydrogen bonding. Top view of a computational model ${ }^{5}$ of a $P P$ shifted dimer ${ }^{4}$ containing a flexible linker unit with a flexible peg2 (a), peg3 (b) and peg4 (c) backbone, respectively. Side view of a computational model ${ }^{5}$ of a $P P$ shifted dimer ${ }^{4}$ containing a flexible linker unit with a flexible peg2 (d), peg3 (e) and peg4 (f) backbone, respectively. The hydroxyl protons and carbonyl oxygen atoms of the hydrogen-bonding arrays are shown as yellow and red balls. Non-hydrogen-bonded hydroxyl groups are marked in brown. Blue helices represent $P$-handedness. The flexible linker is shown in dark green. Hydrogen and other side-chains are omitted for clarity.

Figure S7. Energy minimized models ${ }^{5}$ of $P M$ parallel dimers ${ }^{2}$ connected by flexible linkers of different lengths. Only minor perturbations are observed. ${ }^{1,4}$ Top view of a computational model ${ }^{5}$ of a $P M$ parallel dimer ${ }^{2}$ containing a flexible linker unit with a flexible peg2 (a), peg3 (b) and peg4 (c) backbone, respectively. Side view of a computational model ${ }^{5}$ of a $P M$ parallel dimer ${ }^{2}$ containing a flexible linker unit with a flexible peg2 (d), peg3 (e) and peg4 (f) backbone, respectively. Purple and blue helices represent $M$ - and $P$ handedness, respectively. The hydroxyl protons and carbonyl oxygen atoms of the hydrogen-bonding arrays are shown as yellow and red balls. The flexible linker is shown in green. Hydrogen and other side-chains are omitted for clarity. The linker amide bond is turned out of the plane (marked in light green) in (d).

Figure S8. Energy minimized models ${ }^{5}$ of $P M$ clockwise tilted dimers emphasizing the insufficient length of even the longest linker. Top- (a), side- (b) and front-view (c) of a computational model ${ }^{5}$ of a PM clockwise tilted dimer in respect to head-to-tail arrangement containing a flexible linker unit with a peg4-backbone. Here the flexible linker is only linked to one helix and not to the other. The great distance between the linker and the N -Terminus of the other not connected helix is marked by a green arrow in (c). This amplifies the unlikelihood of the formation of a PM-clockwise tilted dimer (with respect to head-to-head arrangement). Computational model ${ }^{5}$ of a PM-clockwise tilted dimer (with respect to head-to-head arrangement) stabilized by a flexible linker with a peg4-backbone. Here the linker goes through the helix (d), part of the linker is stretched (e) or the helix-partially unfolds (f). The unlikely conformations are marked in green. The hydroxyl protons and carbonyl oxygen atoms of the hydrogen-bonding arrays are shown as yellow and red balls. Blue and purple helices represent $P$ - and $M$-handedness, respectively. The flexible linker is shown in dark green. Hydrogens and other side-chains are omitted for clarity. This model has only been modelled in the case of a peg4-based linker.

Figure S9. Energy minimized models ${ }^{5}$ of $P P$ counterclockwise tilted dimers connected by flexible linkers of different lengths. T3-2eg and T3-3eg linkers perturb the conformation. Top view of a computational model ${ }^{5}$ of a PP counterclockwise tilted dimer with respect to head-to-head arrangement containing a flexible linker unit with a flexible peg2 (a), peg3 (b) and peg4 (c) backbone, respectively. Side view of a computational model ${ }^{5}$ of a PP counterclockwise tilted dimer with respect to head-to-head containing a flexible linker unit with a flexible peg2 (d), peg3 (e) and peg4 (f) backbone, respectively. The hydroxyl protons and carbonyl oxygen atoms of the hydrogen-bonding arrays are shown as yellow and red balls. Blue helices represent $P$ handedness, respectively. The flexible linker is shown in dark green. Hydrogens and other side-chains are omitted for clarity. The linker amide bond is turned out of the plane (marked in pink) in (d) and (e).

Figure S10. Energy minimized models ${ }^{5}$ of $P M$ counterclockwise tilted dimer connected by flexible linkers of different lengths. ${ }^{6}$ Top view of a computational model ${ }^{5}$ of a $P M$ counterclockwise tilted dimer with respect to head-to-tail arrangement containing a flexible linker unit with a flexible peg2 (a), peg3 (b) and peg4 (c) backbone, respectively. Side view of a computational model ${ }^{5}$ of a $P M$ counterclockwise tilted dimer with respect to head-to-tail arrangement containing a flexible linker unit with a flexible peg2 (d), peg3 (e) and peg4 (f) backbone, respectively. The hydroxyl protons and carbonyl oxygen atoms of the hydrogen-bonding arrays are shown as yellow and red balls. Blue and purple helices represent $P$ - and $M$-handedness, respectively. The flexible linker is shown in dark green. Hydrogens and other side-chains are omitted for clarity.

Figure S11. Energy minimized models ${ }^{5}$ of PP clockwise tilted dimer connected by flexible linkers of different lengths. All linkers seem compatible witht the helix-helix arrangement.Top view of a computational model ${ }^{5}$ of a PP clockwise tilted dimer with respect to head to head containing a flexible linker unit with a flexible peg2 (a), peg3 (b) and peg4 (c) backbone, respectively. Side view of a computational model ${ }^{5}$ of a $P P$ clockwise tilted dimer with respect to head to head containing a flexible linker unit with a flexible peg2 (d), peg3 (e) and peg4 (f) backbone, respectively. The hydroxyl protons and carbonyl oxygen atoms of the hydrogenbonding arrays are shown as yellow and red balls. Blue helices represent $P$-handedness, respectively. The flexible linker is shown in dark green. Hydrogens and other side-chains are omitted for clarity. Blue helices represent $P$-handedness, respectively.

Figure S12. Confirmation of the formation of a $P$-homochiral species in 9-11. CD spectra of 6, 9, 10 and 11 in chloroform between 250 and 500 nm at $25^{\circ} \mathrm{C}$. The molar extinction $(\Delta \varepsilon)$ is normalized for the number of Q units for better comparability.

Figure S13. A single species of 9 prevails over a range of concentrations. Part of the ${ }^{1} \mathrm{H}$ NMR spectra ( 500 $\mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ after 2 weeks showing amide resonances of 9 at $6.28 \mathrm{mM}(\mathrm{a}), 3.14 \mathrm{mM}$ (b), 1.57 mM (c), and $0.79 \mathrm{mM}(\mathrm{d})$, respectively.

Figure S14. A single species of 10 prevails over a range of concentrations. Part of the ${ }^{1} \mathrm{H}$ NMR spectra (500 $\mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ after 2 weeks showing amide resonances of 10 at $13.90 \mathrm{mM}(\mathrm{a}), 6.95 \mathrm{mM}(\mathrm{b}), 3.48 \mathrm{mM}$ (c), $1.74 \mathrm{mM}(\mathrm{d})$, and 0.87 mM (e), respectively.

Figure S15. A single species of 11 prevails over a range of concentrations. Part of the ${ }^{1} \mathrm{H}$ NMR spectra (500 $\mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ after 2 weeks showing amide resonances of 11 at $18.49 \mathrm{mM}(\mathrm{a}), 9.24 \mathrm{mM}(\mathrm{b}), 4.62 \mathrm{mM}$ (c), $2.31 \mathrm{mM}(\mathrm{d}), 1.16 \mathrm{mM}$ (e) and 0.58 mM (f), respectively.

Figure S16. Identification of hydrogen bonded OH signals of 9 in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 9 at 6.28 mM and 2 weeks after pyridine-treatment. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S17. Identification of hydrogen bonded $\mathbf{O H}$ signals of $\mathbf{1 0}$ in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 10 at 13.90 mM and 2 weeks after pyridinetreatment. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S18. Identification of hydrogen bonded OH signals of 11 in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 11 at 2.31 mM and 2 weeks after pyridinetreatment. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S19. Compound 9 has the same hydrodynamic radius as its protected precursor, and is thus monomeric. Extract of ${ }^{1} \mathrm{H} \operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of a 1 to 1 mixture of 9 and its protected precursor 24 each at 1.62 mM , and after 3 weeks showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=115 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 9 and 24 is $2.67 \times 10^{-}$ ${ }^{5}$, each.

Figure S20. Compound 9 has a similiar hydrodynamic radius to $10,11,13,15$ and 17. Extract of ${ }^{1} \mathrm{H}$ DOSY ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ of 9 at 1.62 mM and after 2 weeks showing amide resonances and hydrogenbonded hydroxyl groups, respectively. $\Delta=75 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 9 is $8.62 \times 10^{-5}$.

Figure S21. Compound 10 has a similiar hydrodynamic radius to 9, 11, 13, 15 and 17. Extract of ${ }^{1} \mathrm{H}$ DOSY ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ of 10 at 1.62 mM and after 2 weeks showing amide resonances and hydrogenbonded hydroxyl groups, respectively. $\Delta=250 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of $\mathbf{1 0}$ is $6.40 \times 10^{-5}$.

Figure S22. Compound 10 has the same hydrodynamic radius as its protected precursor, and is thus monomeric. Extract of ${ }^{1} \mathrm{H} \operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of a 1 to 1 mixture of 10 and its protected precursor 26 at 1.39 mM , each and after 2 days showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. Here signals corresponding to 10 are more broad. $\Delta=250 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 10 and 26 is $2.10 \times 10^{-4}$, each.

Figure S23. Compound 11 has a similiar hydrodynamic radius to $9,10,13,15$ and 17, and is thus monomeric. Extract of ${ }^{1} \mathrm{H}$ DOSY ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ of 11 at 1.39 mM and after 2 weeks showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=200 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 11 is $1.08 \times 10^{-5}$.

Figure S24. Compound 11 has the same hydrodynamic radius as its protected precursor, and is thus monomeric. Extract of ${ }^{1} \mathrm{H} \operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of a 1 to 1 mixture of 11 and its protected precursor 28 at 1.39 mM , each and after 12 hours showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. Here signals corresponding to 11 are more broad and a $2^{\text {nd }}$ species is formed. $\Delta=200 \mathrm{~ms}, \delta=$ 0.6 ms . The extracted value of the diffusion coefficient of $\mathbf{1 1}$ and $\mathbf{2 8}$ is $2.10 \times 10^{-4}$, each.

Figure S25. Identification of hydrogen bonded $\mathbf{O H}$ signals of $\mathbf{1 2}$ in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 12 at 15.04 mM and 2 weeks after pyridinetreatment. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S26. The spectrum of 12 does not depend on concentration. Part of the ${ }^{1} \mathrm{H} N M R$ spectra ( 500 MHz , $25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ after 2 weeks showing amide resonances of 12 at $15.04 \mathrm{mM}(\mathrm{a}), 7.52 \mathrm{mM}(\mathrm{b}), 3.76 \mathrm{mM}(\mathrm{c})$, $1.88 \mathrm{mM}(\mathrm{d}), 0.94 \mathrm{mM}(\mathrm{e})$ and 0.47 mM (f), respectively.

Figure S27. Compound 9 and 12 form the enantiomeric species and fold without interfering with one another. Extracts of ${ }^{1} \mathrm{H}$ NMR spectra ( $500 \mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) of 9, 12 and a 1:1-mixture of 9 and 12 in $\mathrm{CDCl}_{3}$ at 2.3 mM (in total) each before (blue) and after disruption by pyridine (green) showing the amide region and hydrogen-bonded hydroxyl groups (a). CD spectra of 9, 12 and a 1:1-mixture of $\mathbf{9}$ and $\mathbf{1 2}$ in $\mathrm{CHCl}_{3}$ before disruption by pyridine between 250 and $500 \mathrm{~nm}(\mathrm{~b})$. The molar extinction $(\Delta \varepsilon)$ is normalized for the number of $Q$ units for better comparability.

Figure S28. Assignment of $P$-helicity in 13 and 15. CD spectra of 5, 13 and 15 in chloroform between 250 and 500 nm at $25^{\circ} \mathrm{C}$. The molar extinction $(\Delta \varepsilon)$ is normalized for the number of $Q$ units for better comparability.

Figure S29. Compound 13 has a similiar hydrodynamic radius to $9,10,11,15$ and 17, and is thus monomeric. Extract of ${ }^{1} \mathrm{H}$ DOSY $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of 13 at 1.62 mM and after 2 weeks showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=275 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 13 is $1.95 \times 10^{-5}$.

Figure S30. Compound 13 has the same hydrodynamic radius as its protected precursor, and is thus monomeric. Extract of ${ }^{1} \mathrm{H} \operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of a 1 to 1 mixture of 13 and its protected precursor 32 at 0.74 mM , each and after 4 days showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. Here some signals corresponding to 13 appear more broad. $\Delta=275 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of $\mathbf{1 3}$ and 32 is $5.56 \times 10^{-4}$, each.

Figure S31. Compound 15 has a similiar hydrodynamic radius to $9,10,11,13$ and 17, and is thus monomeric. Extract of ${ }^{1} \mathrm{H} \operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of 15 at 1.62 mM and after 2 weeks showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=100 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 15 is $4.76 \times 10^{-5}$.

Figure S32. Compound 15 has the same hydrodynamic radius as its protected precursor, and is thus monomeric. Extract of ${ }^{1} \mathrm{H} \operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of a 1 to 1 mixture of 15 and its protected precursor 36 at 0.4 mM and 1.39 mM , respectively and after 1 week showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=275 \mathrm{~ms}, \delta=0.6 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 15 and 36 is $2.11 \times 10^{-4}$, each.

Figure S33. Identification of hydrogen bonded $\mathbf{O H}$ signals of 13 in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 13 at 7.73 mM and 2 weeks after pyridinetreatment. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S34. Identification of hydrogen bonded $\mathbf{O H}$ signals of $\mathbf{1 5}$ in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 15 at 9.0 mM and 2 weeks after pyridinetreatment. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S35. Identification of hydrogen bonded $\mathbf{O H}$ signals of 17 in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 17 at 7.73 mM and 2 weeks after pyridinetreatment. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S36. Compound 17 has a similiar hydrodynamic radius to $9-11,13 \& 15$, and is thus monomeric. Extract of ${ }^{1} \mathrm{H}$ DOSY $(500 \mathrm{MHz}, \mathrm{CDCl} 3)$ at $25^{\circ} \mathrm{C}$ of 17 at 1.62 mM and after 2 weeks showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=100 \mathrm{~ms}, \delta=1.0 \mathrm{~ms}$. The extracted value of the diffusion coefficient of 17 is $2.63 \times 10^{-5}$.

Figure S37. Compound 17 has the same hydrodynamic radius as its protected precursor, and is thus monomeric. Extract of ${ }^{1} \mathrm{H} \operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of a 1 to 1 mixture of 17 and its protected precursor 40 at 0.45 mM , each and after 1 week showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=110 \mathrm{~ms}, \delta=1.0 \mathrm{~ms}$. The extracted value of the diffusion coefficient of $\mathbf{1 7}$ and $\mathbf{4 0}$ is $1.16 \times 10^{-}$ ${ }^{4}$, each.

Figure S38. Compound 16 has a different hydrodynamic radius from its protected precursor. Extract of ${ }^{1} \mathrm{H}$ $\operatorname{DOSY}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ at $25^{\circ} \mathrm{C}$ of a 1 to 1 mixture of $\mathbf{1 6}$ and its protected precursor $\mathbf{3 8}$ at 3.24 mM , respectively and after 3 weeks showing amide resonances and hydrogen-bonded hydroxyl groups, respectively. $\Delta=110 \mathrm{~ms}, \delta=1.0 \mathrm{~ms}$. The extracted value of the diffusion coefficient of $\mathbf{1 6}$ and $\mathbf{3 8}$ is $4.81 \times 10^{-}$ ${ }^{5}$ and $5.32 \times 10^{-5}$, respectively.

Figure S39. The spectrum of 16 does not depend on concentration. Part of the ${ }^{1} \mathrm{H} N M R$ spectra ( 500 MHz , $25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ after 2 weeks showing amide resonances of 16 at 7.41 mM (a), 3.70 mM (b), 1.85 mM (c), $0.93 \mathrm{mM}(\mathrm{d})$ and $0.46 \mathrm{mM}(e)$, respectively.

Figure S40. The aggregate formed by 16 is stable over a wide range of temperature. Part of the $800 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectra of 16 ( 6.90 mM in $\mathrm{CDCl}_{3}$ ) showing the amide and hydroxy proton resonances at different temperatures. The corresponding temperatures are indicated at left.

Figure S41. Identification of hydrogen bonded $\mathbf{O H}$ signals of 16 in $\mathrm{CDCl}_{3}$. Part of the ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) at $25^{\circ} \mathrm{C}$ showing amide resonances of 16 at 7.73 mM after a two-week incubation. Only NH resonances correlate, blue dots indicate the signals of OH protons.

Figure S42. Comparison of the previously described trimeric bundle ${ }^{1}$ and the one found in the crystal structure of 16. Top- (a) and side-view (i) of crystal structure and hydrogen-bonding patterns (c \& d) of a trimer of 2. ${ }^{1}$ Top- (b) and side-view (j) of crystal structure and hydrogen-bonding patterns (eh, k, l) of the distorted trimetric hydrogen bonding interface of 16 . Hydrogen bonds found in the distorted trimer in 16 are marked with boxes in the corresponding color in j. Here hydrogen bonds at the same level as in the trimer of $\mathbf{2}$ are marked in the same color. Hydrogen bonds belonging to $\mathbf{2}$ are marked with boxes using dashed lines in the same colors. The X -unit belonging to helices of the dimetric hydrogen bonding interface is marked with a black circle in j \& I. The hydroxy groups and carbonyl groups of the hydrogen-bonding arrays are shown as yellow and red balls, respectively. Water molecules are shown as green balls. X-units, $Y$-units and linker units are shown in blue, violet and green tubes, respectively. Included solvent molecules, hydrogen and other side-chains are omitted for clarity.

Figure S43. Comparison of the previously described dimeric bundle ${ }^{4}$ and the one found in the crystal structure of 16. Top- (a) and side-view (b) of crystal structure and hydrogen-bonding patterns (c \& d) of the shifted head-to-tail PM dimeric hydrogen bonding interface of 16. Top- (e) and side-view (f) of crystal structure and hydrogen-bonding patterns ( $\mathrm{g} \& \mathrm{~h}$ ) of a shifted head-to-tail PM dimer of 3. ${ }^{4}$ The hydroxyl protons and carbonyl oxygen atoms of the hydrogen-bonding arrays are shown as yellow and red balls, respectively. Water molecules are shown as green balls. The $X$-units are shown in blue and the $Y$ units in violet tubes. Included solvent molecules, hydrogens and other side-chains are omitted for clarity.

Quinoline-quinolinone-equilibrium of a C-terminal X-unit belonging to a B and $B^{\prime}$-domain (a). Part of the crystal structure of 16 showing a X-quinoline unit (b) and a X-quinolinone unit (c). Side- (d) and top- (e) view of the C-terminal helix of a B and $B^{\prime}$-domain. The flipped X-quinolinone unit is marked with a blue circle in (d) and shown in blue in (e). Side chains, hydrogen atoms and included solvent molecules are omitted for clarity.

Figure S45. Control experiment to verify that thermodynamic equilibrium is reached in spectra of 13. Part of the ${ }^{1} \mathrm{H}$ NMR spectra ( $500 \mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ at 5.8 mM showing amide resonances of 13 after 24 hours (a), 1 week (b) and 2 weeks (c), respectively.

Figure S46. Control experiment to verify that thermodynamic equilibrium is reached in spectra of 15. Part of the ${ }^{1} \mathrm{H}$ NMR spectra ( $500 \mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ at 7.5 mM showing amide resonances of $\mathbf{1 5}$ after 24 hours (a), 1 week (b) and 2 weeks (c), respectively.

Figure S47. Control experiment to verify that thermodynamic equilibrium is reached in spectra of 17. Part of the ${ }^{1} \mathrm{H}$ NMR spectra ( $500 \mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ at 7.5 mM showing amide resonances of $\mathbf{1 7}$ after 24 hours (a), 3 weeks (b) and 6 weeks (c), respectively.

Figure S48. Control experiment to verify that thermodynamic equilibrium is reached in spectra of 16. Part of the ${ }^{1} \mathrm{H}$ NMR spectra ( $500 \mathrm{MHz}, 25^{\circ} \mathrm{C}$ ) in $\mathrm{CDCl}_{3}$ at 7.5 mM showing amide resonances of $\mathbf{1 6}$ after 24 hours (a), 3 weeks (b) and 6 weeks (c), respectively.

## 3 Supplementary methods

### 3.1 HRMS analyses

HR-MS spectra were recorded on a Bruker microTOF II by direct infusion from acetonitrile in positive ionization mode. The instrument was calibrated in positive mode by direct infusion of a calibration solution (Agilent Technologies ESI-L Low Concentration Tuning Mix). The mass sample was prepared by adding $10 \mu \mathrm{~L}$ of a solution of the sample in $\mathrm{DCM}(0.1 \mathrm{mg} / \mathrm{mL})$ to 1 mL of a solution of $0.1 \%$ formic acid in acetonitrile.

### 3.2 Molecular modelling

Models were simulated by using Maestro version 11.5 (Schrödinger Inc.). Energy minimized structures were obtained using MacroModel energy minimization with the following parameters: force field: MMFFs; solvent: none; electrostatic treatment: constant dielectric; dielectric constant: 1.0; charges from: force field; cutoff: normal; Van der Waals: 7.0; electrostatic: 12.0 ; H -bond: 4.0 ; mini method: TNCG; maximum iterations: 2500; converge on: gradient; convergence threshold: 0.05; constraints: distances. As a starting point, the coordinates of previously described crystal structures CCDC entry \# 1451494 (PP clockwise and counterclockwise tilted dimer), ${ }^{1}$ CCDC entry \# 2209187 ( for models of PP shifted head-to-tail dimer), ${ }^{4}$ CCDC entry \# 1955168 (for models of PM parallel head-to-tail dimer), ${ }^{2}$ CCDC entry \# 2209189 (for models of PM shifted head-to-tail dimer), ${ }^{4}$ were used. For models of the $P M$ clockwise and counterclockwise tilted dimer the crystal structures CCDC entry \# $1451494^{1}$ and CCDC entry \# $2209189^{4}$ were combined. A single helix was first energy-minimized. In a second round, two helices were placed in a plausible arrangement, and distance constraints between plausible hydrogen-bonding partners were set on purpose to 2.5 . While setting the constraints, it was important to match the hydroxy group to their correct hydrogen-bonding carbonyl partner. The energyminimized model was fixed regarding possible unlikely conformations and energy-minimized again. Then all constraints were removed, and energy minimization was repeated. Typically, only minimal changes occurred at this stage. Then the connecting T3-linker was introduced, and the model again energy minimized without fixed distances. If no changes were observed another energy minimization with fixed distances has been run. If afterwards no changes were observed the structure was exported as a mol2-file.

### 3.3 Nuclear magnetic resonance spectroscopy

NMR spectra were recorded on different NMR spectrometers: (I) an Avance III HD NMR spectrometer 500 MHz (Bruker BioSpin) with CryoProbe ${ }^{\text {TM }}$ Prodigy for ${ }^{1} \mathrm{H}$ NMR, ${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}-\mathrm{HSQC}$, and DOSY spectra of foldamers. (II) an Avance III HD NMR spectromter 800 MHz with cryoprobe (Bruker BioSpin) for variable temperature measurements. Chemical shifts are described in part per million (ppm, $\delta$ ) relative to the ${ }^{1} \mathrm{H}$ residual signal of the deuterated solvent used. Meaning DMSO- $d_{6}(\delta 2.50 \mathrm{ppm})$, pyridine- $d_{5}(\delta 8.74$ $\mathrm{ppm}), \mathrm{CD}_{2} \mathrm{Cl}_{2}(\delta 5.32 \mathrm{ppm})$ and $\mathrm{CDCl}_{3}(\delta 7.16 \mathrm{ppm}) .{ }^{1} \mathrm{H}$ NMR splitting patterns with observed first-order coupling are entitled as singlet ( s ), doublet ( d ), triplet ( t ), quartet ( q ), multiplet ( m ) or broad singlet (bs). Coupling constants (J) are ported in Hertz.

Sample preparation and incubation times to reach equilibrium required attention. The required equilibration times of sequences 9-17 were estimated by equilibrating each sample in $\mathrm{CDCl}_{3}$ after complete disruption of the aggregates. Complete disruption was achieved by dissolving the sample in pyridine and then evaporating the solvent. Spectra were measured at different time intervals from 2 h to 6 weeks until no further change was observed.

In the case of sequences 9-12 and 14, equilibration times were generally fast (around 5 min ). Samples were typically incubated for $2 h$, which gave a large margin. In the case of 13,15 and 17 , equilibration times are considerably longer, and incubation of two to three weeks is indicated (Figures S45-47). In the case of $\mathbf{1 6}$, slight changes in regard to signal sharpening are observed over time (Figure S48).
${ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}$-HSQC spectra were recorded with a phase-sensitive pulse sequence with sensitivity enhancement using trim pulses in inept transfer (hsqcetgpsi2) from the Bruker pulse program library. Data acquisition was performed utilizing non-uniform sampling (NUS; NUS amount: $50 \%$ with an automatically created NUSList) yielding 1024 (F2) x 128 (F1) data points in Echo/Antiecho gradient selection mode. The recycling delay was 2.0 s and 64 transients per increment were applied at a sweep width of 2.5 kHz in F 2 and 7 kHz in F1 resulting in an acquisition time of 0.1462 s . NUS processing was performed using the fully automated NUS processing tool provided by MestReNova. Zero filling in F1 has been used to yield a final matrix of $1 \mathrm{~K} \times 1 \mathrm{~K}$ real points.

The DOSY spectra were recorded by applying a pulse sequence with stimulated echo using bipolar gradient pulses for diffusion from the Bruker pulse program library (stebpgp1s). The diffusion delay $\Delta$ (big delta) and the diffusion gradient pulse length $\delta$ (little delta) was set to values specified in the respective capture. The number of gradient steps were set to 32 with linear spacing starting from $2 \%$ reaching $95 \%$ of the full gradient strength in the final step. For each of the 32 gradient amplitudes, 256 transients of 65 k complex data points were acquired. DOSY processing was performed with the DOSY processing tool from MestReNova (v.12.x64) employing the Peak Heights Fit algorithm including the
autocorrect peak position with 32 points in diffusion dimension and a window of $1.00^{*} 10^{-6}$ to $1.00^{*} 10^{-}$ ${ }^{2} \mathrm{~cm}^{2} \mathrm{~s}^{-1}$.

### 3.4 CD studies

All CD spectra were recorded on a Jasco J-810 spectrometer with 10 mm quartz cuvette. The following parameters were used: wavelength range from 500 to 250 nm . Scan speed: $200 \mathrm{~nm} / \mathrm{min}$; accumulation: 3; response time: 1.0 s ; bandwidth: 2; temperature: $25^{\circ} \mathrm{C}$; sensitivity: standard ( 100 mdeg); data pitch: 1 nm ; nitrogen gas flow rate: $500 \mathrm{~L} / \mathrm{h}$. The sample solution was prepared in distilled chloroform or DCM filtered over alumina before use. $\Delta \varepsilon$ values (in $\mathrm{cm}^{2} . \mathrm{mmol}^{-1}$ ) were obtained by using the formula: $\Delta \varepsilon=\mathrm{m}^{\circ} /(\mathrm{C} . \mathrm{I} .32980)$ where $\mathrm{m}^{\circ}=\mathrm{CD}$ value in millidegrees; $\mathrm{I}=$ cuvette pathlength $\mathrm{in} \mathrm{cm} ; \mathrm{C}=$ sample concentration in $\mathrm{mol} / \mathrm{L}$. The CD spectra of all samples were carried out at 0.01 mM in chloroform and DCM. Thus, a solution of each in pyridine was prepared, and the same volume was taken, respectively. After the removal of the solvent, the samples were dissolved and incubated in chloroform or DCM.

### 3.5 X-ray crystallography

Single crystal weres obtained from an acetonitrile, chloroform and toluene mixture. Solvents were not dried. X-ray diffraction experiments for $\mathbf{1 6}$ were performed at the IECB x-ray facility (CNRS UMS 3033, University of Bordeaux) with a Rigaku FRX rotating anode ( $2.9 \mathrm{~kW} \mathrm{)} \mathrm{diffractometer}$. monochromated with high flux Osmic Varimax HF mirrors for data collection. The x-ray source is equipped with a Pixel Hybrid Dectris Eiger 1M detector and partial chi goniometer (AFC11). The data were processed with CrysAlis PRO software ${ }^{7}$ with a multiscan absorption correction. Crystal was kept at $100(2) \mathrm{K}$ during data collection. The structure was solved with the $\mathrm{ShelX}^{8}$ structure solution program using a dual-space algorithm. Crystal model refinement was performed with SheIXL ${ }^{9}$ package using Least Squares minimization implemented in Olex2 ${ }^{10}$.

During refinement, anisotropic displacement parameters were used only for backbones. For two isobutoxy side chains, not all C atoms were found (in total three carbon atoms are missing from the model). Also, the H atom of one hydroxyl group that do not form hydrogen bonds, the hydrogen atoms of isobutyl side chains, of the methyl groups of terminal esters and $\mathrm{Se}-\mathrm{CH} 3$ substituent and of acetonitrile molecules were not localized. However, these atoms must belong to the structure and be involved in X-ray diffraction. They were thefore included in SFAC calculations. The difference between the formula unit and and the refined atoms is $\mathrm{C} 3, \mathrm{H} 151$. The foldamer molecules' C -and N -bound hydrogen atoms were placed in an idealized position. H atoms of side chains were not localized.

Hydrogen atoms of water molecules and OH groups of foldamer molecules were identified based on possible hydrogen bond interactions. All H atoms were refined in the riding-model approximation, with $\mathrm{U}_{\text {iso }}(\mathrm{H})=1.2 \mathrm{U}_{\text {eq }}\left(\mathrm{CH}, \mathrm{CH}_{2}, \mathrm{NH}\right), \mathrm{U}_{\text {iso }}(\mathrm{H})=1.5 \mathrm{U}_{\text {eq }}\left(\mathrm{OH}, \mathrm{CH}_{3}\right)$. EADP and DELU instructions were employed to model temperature parameters. The geometry of the molecules was improved with DFIX and AFIX commands.

Wide channels occupying about $35 \%$ of the unit cell volume are formed in the structure. These channels are filled with severely disordered solvent molecules that were removed using the solvent masking procedure implemented in Olex29. The solvent radius was set to $1.2 \AA$, and the calculated total potential solvent-accessible void volume and electron counts per unit cell were $7644 \AA^{3}$ and 1939. Considering the high number of electrons calculated for the channels and the variety of solvents used for crystallization, it is impossible to determine the solvent composition reliably. However, structure factors include contributions from the .fab file.

The final cif files were checked using IUCR's checkcif algorithm. Due to the characteristics of the crystal, i.e. large volume fractions of disordered solvent molecules, weak diffraction intensity, incompleteness of the data and moderate resolution, $A$ - level and $B$ - level alerts remain in the check cif file. These alerts are inherent to the data and refinement procedures and do not reflect errors. They are explicitly listed below and have been divided into two groups. The first group illustrates the poor quality of the data and refinement statistics compared to that expected for small molecule structures from highly diffracting crystals. The second group is connected to decisions made during refinement and explained below.

## Group 1:

THETM01_ALERT_3_A The value of sine(theta_max)/wavelength is less than 0.550 Calculated $\sin ($ theta_max)/wavelength $=0.4762$
PLAT023_ALERT_3_A Resolution (too) Low [sin(theta)/Lambda < 0.6].. 0.48 Ang-1
PLAT084_ALERT_3_A High wR2 Value (i.e. > 0.25) $\qquad$ 0.48 Report

PLAT934_ALERT_3_A Number of (lobs-Icalc)/Sigma(W) > 10 Outliers .. 77 CheckPLAT082_ALERT_2_B High R1 Value $\qquad$ 0.16 Report

PLAT241_ALERT_2_B High' MainMol' Ueq as Compared to Neighbors
PLAT242_ALERT_2_B Low 'MainMol' Ueq as Compared to Neighbors
Group 2:

PLAT201_ALERT_2_A Isotropic non-H Atoms in Main Residue(s)
Not all atoms were refined with ADPs
PLAT315_ALERT_2_B Singly Bonded Carbon Detected (H-atoms Missing)
Not all H-atoms were localized, but they were used in SFAC calculation

## 5 Experimental Procedures

### 5.1 General methods

Commercially available reagents were purchased from Sigma-Aldrich, Alfa-Aesar or TCI and were used without further purification unless otherwise specified. SASRIN resin (100-200 mesh, loading 0.7-1.0 mmol/g) was purchased from Bachem. Tetrahydrofuran (THF), dichloromethane (DCM) and toluene were dried over alumina columns (MBRAUN SPS-800 solvent purification system); diisopropylethylamine (DIPEA) was distilled over ninhydrin and then over potassium hydroxide ( KOH ); chloroform was distilled over calcium hydride ( $\mathrm{CaH}_{2}$ ) prior to use. Solid phase synthesis (SPS) was performed manually under MW-irradiation on a CEM Discover (Liberty Bio) microwave oven using an open reaction vessel and an internal fibre optic probe for temperature control. High-resolution electrospray mass spectra were recorded on a Thermo Exactive orbitrap instrument.

### 5.2 Solid phase synthesis general methods

The monomers Fmoc- $Q^{B}-O H,{ }^{11}$ Fmoc- $Q^{M}-\mathrm{OH}^{12}$, $\mathrm{Fmoc}^{-} \mathrm{B}^{\mathrm{R}}-\mathrm{OH}^{13}$, $\mathrm{Fmoc}-\underline{X}-\mathrm{OH}^{4}$ ( $\underline{X}$ denotes tBu-protected X ), and Fmoc- $\underline{Y}-\mathrm{OH}^{3}(\underline{Y}$ denotes TMSE-protected $Y$ ) have been synthesized according to literature. The synthesis of Fmoc- $\mathrm{Q}^{\mathrm{s}}-\mathrm{OH}$ and $\mathrm{Fmoc}-\mathrm{B}^{\mathrm{s}}-\mathrm{OH}$ will be published elsewhere.

### 6.3.1 Loading of the resin via HBTU-coupling

SASRIN resin ( $800 \mathrm{mg}, 100-200$ mesh, loading $0.7-1.0 \mathrm{mmol} / \mathrm{g}$ ) was swollen in DMF for 1 h , transferred to the microwave vessel and washed three times with dry DMF (purchased as 'extra-dry' solvent from Acros Organics). DIPEA ( $272 \mu \mathrm{~L}, 2$ eq.) was added to a mixture of $\underline{X}(471 \mathrm{mg} ; 0.7 \mathrm{eq}$.) and HBTU ( $456 \mathrm{mg}, 1.5 \mathrm{eq}$ ) in dry DMF ( 5 mL ), then the mixture was added to the resin. The reaction mixture was subjected to treatment in the microwave ( $50^{\circ} \mathrm{C}, 20 \mathrm{~min}, 25 \mathrm{~W}$ ), then the resin was washed five times with DMF until the washing solution was colourless, then it was washed ten times with DCM. If the loading was sufficient, a capping was performed, otherwise, the resin re-loaded. Capping was performed by adding a mixture of DCM/pyridine/benzoyl chloride ( $\mathrm{v} / \mathrm{v} / \mathrm{v}, 3: 1: 1$ ), and the resin was left for 30 min , then it was rinsed 20 x times with DCM.

### 6.3.2 Estimation of the loading

After drying a small part of the resin under vacuum for 5 h , the loading of the resin was determined. To a small amount of resin ( $1-2 \mathrm{mg}$ ), a freshly prepared mixture of $D M F /$ piperidine ( $\mathrm{v} / \mathrm{v}, 8: 2,3 \mathrm{~mL}$ ) was added. The mixture was shaken and incubated for 5 min . Then the absorption was measured at 290 nm using a NanoDrop One Microvolume UV-Vis Spectrophotometer and a Hellma quartz glass cuvette 104 (path length $10 \mathrm{~mm})$. Three replicates were measured, then the loading was calculated with the following equation:

$$
\begin{equation*}
\text { loading }\left(\text { in } \frac{\mathrm{mmol}}{\mathrm{~g}}\right)=\frac{\mathrm{A}_{290 \mathrm{~nm}}}{1.65 * \mathrm{~m}_{\mathrm{resin}}(\mathrm{in} \mathrm{mg})} \tag{1}
\end{equation*}
$$

### 6.3.3 Solid Phase Synthesis via in-situ-activation

After swelling of the SASRIN resin ( $800 \mathrm{mg}, 100-200$ mesh, loading $0.388 \mathrm{mmol} / \mathrm{g}, 0.310 \mu \mathrm{~mol}$ ) in DMF for 1 h , the resin was transferred into the microwave vessel and washed three times with DMF. For deprotection, an 8:2 mixture of DMF/piperidine ( 6 mL ) was added to the resin and nitrogen was bubbled through the suspension for 3 min . The solution was removed, the resin was washed five times with DMF, and an 8:2 mixture of DMF/piperidine ( 6 mL ) was added again. After bubbling nitrogen through the suspension for 7 min , the resin was washed five times with DMF and five times with THF. For coupling, dry THF ( 4 mL ) and 2,3,5-collidine ( 5 eq. with regards to the resin-loading) were added to the resin. A mixture of the monomer (2 eq. with regards to the resin-loading) and $\mathrm{PPh}_{3}$ (4 eq. with regards to the resin-loading) in dest. chloroform ( 4 mL ) or dry NMP ( 4 mL ) was prepared. All monomers except for Fmoc-P-OH were dissolved in dest. chloroform. Fmoc-P-OH was dissolved in dry NMP. After the addition of trichloroacetonitrile (4 eq. with regards to the resin-loading), this mixture was added to the resin. Then the reaction mixture was subjected to treatment in the microwave $\left(50^{\circ} \mathrm{C}, 5 \mathrm{~min}, 50 \mathrm{~W}\right)$ Then the resin was washed five times with dry THF, then dry THF ( 4 mL ) and 2,3,5-collidine ( 5 eq . with regards to the resin-loading) were added to the resin. Again, a mixture of monomer ( 2 eq. with regards to the resin-loading) and $\mathrm{PPh}_{3}$ (4 eq. with regards to the resinloading) in dest. chloroform ( 4 mL ) or dry NMP ( 4 mL ) with trichloroacetonitrile was prepared and added to the resin. The reaction mixture was again subjected to microwave vessel treatment ( $50^{\circ} \mathrm{C}, 5 \mathrm{~min}, 25 \mathrm{~W}$ ). After washing with DCM, THF, DMF and DCM, in that order, the resin was kept in a swollen state at $10^{\circ} \mathrm{C}$. The sequence Fmoc-NH- $\underline{Y}-\mathrm{Q}-\underline{X}-\mathrm{OH}$ needed to be deprotected by adding an $8: 2$ mixture of DMF/piperidine $(6 \mathrm{~mL})$ to the resin and subjecting it to MW treatment ( $50^{\circ} \mathrm{C}$, $5 \mathrm{~min}, 25 \mathrm{~W}$ ). This step was repeated twice, and the in-situ coupling was then proceeded.

For installation of (1S)-camphanic amide, the resin ( 0.030 mmol ) was Fmoc deprotected ( $20 \%$ piperidine in DMF, $1 \times 3 \mathrm{~min}$ and $1 \times 7 \mathrm{~min}$ ), washed with DMF and dry THF, then a solution of DIPEA ( $31.1 \mu \mathrm{~L}, 10 \mathrm{eq}$ ) in dry THF ( 0.5 mL ) was added to the resin. To this suspension a solution of (1S)-camphanic acid chloride (3 eq.) in dry THF ( 0.5 mL ) was added, and rests on the reaction vessel was rinsed down with dry THF ( 0.5 mL ). The reaction was carried out under MW irradiation ( 25 W ) at $50^{\circ} \mathrm{C}$ for 5 min . The resin was washed briefly with dry THF, and the process was repeated. Successively the resin was washed with DMF and DCM.

### 6.3.4 Mini Cleavage

To perform a mini cleavage, SASRIN resin ( $\sim 5 \mathrm{mg}$ ) was swelled in DCM for 15 min , then HFIP [DCM ( 2.8 mL ) and HFIP ( 1.2 mL )] were added, and the mixture was stirred at $\mathrm{r} . \mathrm{t}$. for 1 h . Then the solvent was evaporated.

### 6.2.3 Full Cleavage

To perform the full cleavage, SASRIN resin ( $\sim 50 \mathrm{mg}$ ) was swelled in DCM for 15 min , HFIP [DCM/HFIP, v/v, 1:1 ( 6 mL in total)] was added, and the mixture was stirred at r . t . for 12 h . Then the solvent was evaporated. The process was repeated until no more foldamer is left on the resin (up to three times).

### 5.3 Synthesis of oligomers

### 6.3.1 Synthesis of sequences to test handedness-induction via chiral B-unit

$\mathrm{O}_{2} N-Q^{B} \underline{X} Q^{B} Q^{B} \underline{Y} Q^{B} \underline{X}-\mathbf{O H}(18)$ Compound 18 was synthesized using the SPS procedures reported in 5.2 on SASRIN resin loaded via HBTU-coupling described in 5.2 (scale: $78 \mu \mathrm{~mol}$ ). After full cleavage and precipitation in ethyl acetate/n-Hex, the product was obtained as a yellow solid ( $61.13 \mathrm{mg}, 45 \%$ ). ${ }^{1} \mathbf{H} \mathbf{N M R}$ ( 500 MHz , $\mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta[\mathrm{ppm}] 11.61(\mathrm{~s}, 1 \mathrm{H}), 11.26(\mathrm{~d}, \mathrm{~J}=4.0 \mathrm{~Hz}, 2 \mathrm{H}), 11.18(\mathrm{~s}, 1 \mathrm{H}), 10.96(\mathrm{~s}, 1 \mathrm{H}), 8.70(\mathrm{~d}, \mathrm{~J}=3.9 \mathrm{~Hz}$, 1 H ), $8.50-8.47(\mathrm{~m}, 1 \mathrm{H}), 8.40(\mathrm{dd}, \mathrm{J}=8.2,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.32(\mathrm{dd}, \mathrm{J}=7.5,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.12(\mathrm{~d}, \mathrm{~J}=1.3 \mathrm{~Hz}, 1 \mathrm{H})$, 8.05 (dd, J = 10.1, 1.3 Hz, 2H), $8.03-7.97(\mathrm{~m}, 3 \mathrm{H}), 7.86-7.82(\mathrm{~m}, 1 \mathrm{H}), 7.77(\mathrm{dd}, \mathrm{J}=8.3,1.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.62-$ $7.58(\mathrm{~m}, 3 \mathrm{H}), 7.43-7.38(\mathrm{~m}, 3 \mathrm{H}), 7.37-7.32(\mathrm{~m}, 2 \mathrm{H}), 7.21-7.16(\mathrm{~m}, 2 \mathrm{H}), 6.97(\mathrm{~d}, \mathrm{~J}=2.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.73(\mathrm{~s}, 1 \mathrm{H})$, $6.60(\mathrm{~d}, \mathrm{~J}=2.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.35(\mathrm{~s}, 1 \mathrm{H}), 6.26(\mathrm{~s}, 1 \mathrm{H}), 4.00-3.98(\mathrm{~m}, 2 \mathrm{H}), 3.90-3.87(\mathrm{~m}, 1 \mathrm{H}), 3.83-3.81(\mathrm{~m}, 1 \mathrm{H})$, $3.79-3.75(\mathrm{~m}, 1 \mathrm{H}), 2.51-2.42(\mathrm{~m}, 1 \mathrm{H}), 2.34-2.21(\mathrm{~m}, 2 \mathrm{H}), 1.78-1.66(\mathrm{~m}, 4 \mathrm{H}), 1.61-1.54(\mathrm{~m}, 7 \mathrm{H}), 1.53-$ $1.44(\mathrm{~m}, 9 \mathrm{H}), 1.38-1.28(\mathrm{~m}, 12 \mathrm{H}), 1.23-1.13(\mathrm{~m}, 6 \mathrm{H}), 1.10-0.99(\mathrm{~m}, 3 \mathrm{H}), 0.90-0.80(\mathrm{~m}, 12 \mathrm{H}), 0.24(\mathrm{~s}, 9 \mathrm{H})$. ## 7 NMR spectra of new compounds

### 7.1 Sequences to test handedness-induction via chiral B-unit

Figure S49. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 18.

Figure S50. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 4 .

Figure S51. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 19.

Figure S52. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 5 .

Figure S53. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{2 0}$.

Figure S54. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{6}$.

Figure S55. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{2 1 .}$

Figure S56. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 7 .

Figure S57. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{2 2}$.

Figure S58. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 8 .

### 7.2 Sequences with a helix-turn-helix-motif and handedness-control in both helices

Figure S59. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of 23 .

Figure $\mathbf{S 6 0 .}{ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $\mathbf{2 4}$.

Figure S61. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of 9 .

Figure S62. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $\mathbf{2 5}$.

Figure S63. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $\mathbf{2 6}$.

Figure S64. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of $\mathbf{1 0}$.

Figure S65. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $\mathbf{2 7}$.

Figure S66. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $\mathbf{2 8}$.

Figure S67. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of 11 .

Figure S68. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 29.

Figure $\mathbf{S 6 9 .}{ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{3 0}$.

Figure S70. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of $\mathbf{1 2}$.

### 7.3 Sequences with a helix-turn-helix-motif and handedness-control in one helix

Figure S71. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $\mathbf{3 1}$.

Figure S72. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of 32 .

Figure S73. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of $\mathbf{1 3}$.

Figure S74. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 33 .

Figure $\mathbf{S 7 5 .}{ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{3 4}$.

Figure S76. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of 14 .

Figure S77. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{3 5}$.

Figure $\mathrm{S} 78 .{ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{3 6}$.

Figure S79. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of $\mathbf{1 5 .}$

### 7.4 Achiral sequences with a helix-turn-helix-motif

Figure S80. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $\mathbf{3 7}$.

Figure S81. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{3 8}$.

Figure S82. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of 16.

Figure S83. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of 39 .

Figure S84. ${ }^{1} \mathrm{H}$ NMR spectrum ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{4 0}$.

Figure S85. ${ }^{1} \mathrm{H}$ NMR spectrum ( 500 MHz , Pyridine- $d_{5}$ ) of 17.
