## 1. General information and instrumentation

Commercial reagents were purchased from Sigma-Aldrich, Alfa-Aesar or TCI and were used without further purification unless otherwise specified. Tetrahydrofurane (THF) and dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ were dried over alumina columns; chloroform $\left(\mathrm{CHCl}_{3}\right)$, triethylamine ( $\mathrm{Et}_{3} \mathrm{~N}$ ) and diisopropylethylamine (DIPEA) were distilled over calcium hydride $\left(\mathrm{CaH}_{2}\right)$ prior to use. Reactions were monitored by thin layer chromatography (TLC) on Merck silica gel 60-F254 plates and observed under UV light. Column chromatography purifications were carried out on Merck GEDURAN Si60 ( $40-63 \mu \mathrm{~m}$ ). ESI mass spectra were obtained from the Mass Spectrometry Laboratory at the European Institute of Chemistry and Biology (UMS 3033 -IECB), Pessac, France.
2. Preparation and characterization of the complexes in solution

Dimer complexes were prepared according one of the two following methods. The procedures are described for $\mathrm{Q}_{8}-\mathrm{H}$ but can be adapted to any acid-functionalized oligoquinoline foldamer.

1. In an NMR tube, $\mathrm{Q}_{8}-\mathrm{H}(2 \mathrm{mg}, 1 \mu \mathrm{~mol})$ is dissolved in $600 \mu \mathrm{~L}$ of $\mathrm{CDCl}_{3}$. To this solution, a small amount of the desired salt (i.e. $\mathrm{NaOH}, 1 \mathrm{mg}, 25 \mu \mathrm{~mol}$ ) is added. The suspension is shaken for a couple of minutes. Once the complex formation occurs quantitatively as judged by NMR analysis (time varies depending on salt used), the solution can be filtered to obtain the desired dimer complex in solution without salt excess.
2. $\mathrm{Q}_{8}-\mathrm{H}(2 \mathrm{mg}, 1 \mu \mathrm{~mol})$ is dissolved in 2 mL of dichloromethane. The solution is washed with 2 mL of an aqueous saturated solution of the metal salt, then dried over magnesium sulfate and concentrated under reduced pressure to afford the desired metal dimer complex as a solid without salt excess.

Both methods produce dimeric metal complexes quantitatively without difference in purity. The salt excess is successfully removed by using any of the two methods as proved by the addition of initial $\mathrm{Q}_{8}-\mathrm{H}$ to the complexes resulting in a mixture of $\mathrm{Q}_{8}-\mathrm{H}$ and dimeric complexes that are in slow exchange in the NMR time scale.

Sodium-ligated quinoline dimers:

Lithium-ligated quinoline dimers:

Figure S12. ${ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{H}$ b) $\mathrm{Q}_{8}-\mathrm{H}$ and LiOH powder after 20 minc c) 15h

Figure $\mathrm{S} 13 .{ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{H}$ b) $\mathrm{Q}_{8}-\mathrm{Li}-\mathrm{Q}_{8}$ prepared by using aqueous LiOH (sat) c) $\mathrm{Q}_{8}-\mathrm{Li}-\mathrm{Q}_{8}$ prepared by using LiOH powder

Silver-ligated quinoline dimers:

Figure $\mathrm{S} 14 .{ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{H} \mathrm{b}$ ) $\mathrm{Q}_{8}-\mathrm{H}$ and AgOAc powder after 1 h c) 24 h

Figure $\mathrm{S} 15 .{ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{H}$ b) $\mathrm{Q}_{8}-\mathrm{Ag}^{2}-\mathrm{Q}_{8}$ prepared by using aqueous $\mathrm{AgOAc}(\mathrm{sat}) \mathrm{c}) \mathrm{Q}_{8}-\mathrm{Ag}-\mathrm{Q}_{8}$ prepared by using AgOAc powder

Mercury-ligated quinoline dimers:

Figure S16. ${ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{H}$ b) $\mathrm{Q}_{8}-\mathrm{H}$ and $\mathrm{Hg}(\mathrm{OAc})_{2}$ powder after 5 min

Figure 17. ${ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{H}$ b) $\mathrm{Q}_{8}-\mathrm{Hg}^{2}-\mathrm{Q}_{8}$ prepared by using aqueous $\mathrm{Hg}(\mathrm{OAc})_{2}$ (sat) c) $\mathrm{Q}_{8}-\mathrm{Hg}-\mathrm{Q}_{8}$ prepared by using $\mathrm{Hg}(\mathrm{OAc})_{2}$ powder

Figure $\mathrm{S} 18 .{ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8} \mathrm{~b}$ ) $\mathrm{Q}_{8}-\mathrm{K}-\mathrm{Q}_{8} \mathrm{c}$ ) $\left.\mathrm{Q}_{8}-\mathrm{Li}-\mathrm{Q}_{8} \mathrm{~d}\right) \mathrm{Q}_{8}-\mathrm{Ag}-\mathrm{Q}_{8}$ e) $\mathrm{Q}_{8}-\mathrm{Hg}-\mathrm{Q}_{8}$

Competitive experiments with different cations
a)
$\qquad$
b)

Figure $\mathrm{S} 19 .{ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{Ag}_{8}-\mathrm{Q}_{8} \mathrm{~b}$ ) $\mathrm{Q}_{8}-\mathrm{Na}^{-}-\mathrm{Q}_{8} \mathrm{c}$ ) mixture of $\mathrm{Q}_{8}-\mathrm{H}$ with equimolar amounts of NaOH and AgOAc

Very weak signals corresponding to $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8}$ could be detected upon mixing $\mathrm{Q}_{8}-\mathrm{H}$ with NaOH and AgOAc (Figure $\mathrm{S19c}$ ), evidencing that the silver complex is more stable thermodynamically ( $\mathrm{K}_{\mathrm{Ag}}>100 \mathrm{~K}_{\mathrm{Na}}$ ). However, integration was hampered by the weak intensity of these signals and overlapping

Figure S20. ${ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{K}-\mathrm{Q}_{8} \mathrm{~b}$ ) $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8} \mathrm{c}$ ) mixture of $\mathrm{Q}_{8}-\mathrm{H}$ with equimolar amounts of NaOH and KOH

The mixing of $\mathrm{Q}_{8}-\mathrm{H}$ with NaOH and KOH produces both complexes: $\mathrm{Q}_{8}-\mathrm{K}-\mathrm{Q}_{8}$ and $\mathrm{Q}_{8}-$ $\mathrm{Na}-\mathrm{Q}_{8}$. By integration, we can calculate and estimate a ratio of association constants such as $\mathrm{K}_{\mathrm{Na}}=1.25 \mathrm{~K}_{\mathrm{K}}$
a)

Figure $\mathrm{S} 21 .{ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{Li}-\mathrm{Q}_{8}$ b) $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8} \mathrm{c}$ ) mixture of $\mathrm{Q}_{8}-\mathrm{CO}_{2} \mathrm{H}$ with equimolar amounts of LiOH and KOH

Mixing $\mathrm{Q}_{8}-\mathrm{H}$ with LiOH and KOH produces the $\mathrm{Q}_{8}-\mathrm{K}-\mathrm{Q}_{8}$ complex exclusively (Figure S21c) evidencing that $\mathrm{K}_{\mathrm{K}}>100 \mathrm{~K}_{\mathrm{Li}}$

Conclusion: Competitive pairwise experiments performed between the different salts showed that the order of thermodynamic stability of the complexes is as follows: $\mathrm{Ag}>$ $\mathrm{Na}>\mathrm{K}>\mathrm{Li}$. The splitting of the signals when using mercury salt hinders its use in competitive experiments.
3. Dynamics of the complexes in solution: exchange experiments

Figure $\mathrm{S} 22 .{ }^{1} \mathrm{H}$ NMR spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{6}-\mathrm{H}$ b) $\mathrm{Q}_{6}-\mathrm{H}$ and NaOH powder ( $\left.\mathrm{Q}_{6}-\mathrm{Na}-\mathrm{Q}_{6}\right)$

Figure $\mathrm{S} 23 .{ }^{1} \mathrm{H} \mathrm{NMR}$ spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{8}-\mathrm{Na}^{2}-\mathrm{Q}_{8} \mathrm{~b}$ ) an equimolar mixture of $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8}$ and $\mathrm{Q}_{6}-\mathrm{H}$ in the presence of NaOH excess c) $\mathrm{Q}_{6}-\mathrm{Na}-\mathrm{Q}_{6}$

Figure S24. Downfield region (amide NHs) of ${ }^{1} \mathrm{H} \mathrm{NMR}$ spectra ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{Q}_{6}-\mathrm{Na}-\mathrm{Q}_{6} \mathrm{~b}$ ) an equimolar mixture of $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8}$ and $\mathrm{Q}_{6}-\mathrm{H}$ in the presence of NaOH excess c) $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8}$. Protons from heterodimer $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{6}$ are marked with a black dot

## Mixture of (non-chiral) $Q_{8}$ and $Q_{6}$

Figure S25. Schematic representation of dimers formation, using a mixture of non-chiral Q8 and Q6. Both oligomers give right and left handed helices which self-assembled though metal coordination with helices of similar handedness giving rise to 3 pairs of enantiomers.

Peaks from homodimer $R-\mathrm{Q}_{8}-\mathrm{Na}-R-\mathrm{Q}_{8}$ are marked with white squares.

Controlling helical handedness of $Q_{8}$ and $Q_{6}$

Figure S28. Schematic representation of dimers formation, using a mixture of chiral R-Q8 and S-Q6 that fold into helices of opposite handedness. Though metal coordination only helices of similar handedness can self-assembled, allowing only the formation of homodimers.

## 4. Characterization of the complexes in the solid-state

Single crystals used for X-ray diffraction experiments were obtained by diffusion of $n$-hexane to a chloroform solution of the dimer through a dichloromethane buffer solution in the case of $\mathbf{Q}_{\mathbf{8}^{-}}$ $K_{-} \mathbf{Q}_{8}$, to a filtered solution of the complex in chloroform for $\mathbf{Q}_{8}-\mathbf{N a}^{-} \mathbf{Q}_{8}$, and dichloromethane solution for $\mathbf{Q}_{\mathbf{8}}-\mathbf{H g}-\mathbf{Q}_{\mathbf{8}}$. The diffraction data were collected at the IECB x-ray facility (CNCR AUR 3033 - INSERM USO01) with a Rigaku FRX rotating anode ( 2.9 kW ) diffractometer. CuK $\alpha$ radiation monochromated with high flux Osmic Varimax HF mirrors was used for data collection. The xray source was equipped with a Dectris Pilatus 200K detector and a partial chi goniometer. All crystals were kept at 100(2) K during data collection. The data were processed with the Rigaku CrystalClear suite ${ }^{[1]}$ with a multiscan absorption correction. Structures were solved with the SheIXT ${ }^{[2]}$ structure solution program using a dual-space algorithm. Crystal model refinement was performed with ShelXL ${ }^{[3]}$ package using the Least Squares minimization implemented in Olex ${ }^{[4]}$.

The resolution of the data diffraction is lower than expected for medium size molecules due to the characteristics of the crystals, large volume fractions of disordered solvent molecules, instability after removing from the mother liquor, and disorder of side chains. Additionally, crystals of the $\mathbf{Q}_{\mathbf{8}}-\mathbf{N a}-\mathbf{Q}_{\mathbf{8}}$ complex decomposed during data collection, causing not only limited resolution of the data (Figure $S X$ ) but also elevated $\mathrm{R}_{\text {int }}$ and refining factors.

Anisotropic displacement parameters were used during refinement for backbones and some coordinated solvent molecules. In the case of $\mathbf{Q}_{\mathbf{8}}-\mathbf{K}_{\mathbf{K}} \mathbf{Q}_{\mathbf{8}}$, the anisotropic model was also introduced for some of the isobutyl side chains. Other non-hydrogen atoms were refined with isotropic approximation. Due to the high uncertainty of the positions of side chains and solvent molecules, the positions of hydrogen atoms were not calculated. However, those atoms participate in the X-ray diffraction, so they are introduced in the SFAC calculations. Hydrogen atoms of quinoline rings and amide $\mathrm{N}-\mathrm{H}$ groups were placed at an idealized position and were refined in the riding-model approximation, with $\mathrm{U}_{\text {iso }}(\mathrm{H})=1.2 \mathrm{U}_{\text {eq }}(\mathrm{CH}, \mathrm{NH})$. EADP and DELU instructions were employed to model temperature parameters. The geometry of the molecules was improved with DFIX and AFIX commands.

In the structures, wide channels $\left(\mathbf{Q}_{\mathbf{8}}-\mathbf{K}-\mathbf{Q}_{\mathbf{8}}, \mathbf{Q}_{\mathbf{8}}-\mathbf{H g}-\mathbf{Q}_{\mathbf{8}}\right)$ or large voids $\left(\mathbf{Q}_{\mathbf{8}}-\mathbf{N a}-\mathbf{Q}_{\mathbf{8}}\right)$ occupying about
 spaces are filled with severely disordered solvent molecules, which during refinement, were removed using a solvent mask procedure implemented in Olex $2{ }^{[9]}$. The solvent radius was set to $1.2 \AA$ A, and calculated total potential solvent-accessible void volume and electron counts per unitcell were: $3372 \AA^{3}$ and 640 for $\mathbf{Q}_{8}-\mathbf{N a}-\mathbf{Q}_{8}, 1759 \AA^{3}$ and 280 for $\mathbf{Q}_{\mathbf{8}}-\mathbf{K}^{-} \mathbf{Q}_{\mathbf{8}}, 6928 \AA^{3}$ and $1169 \mathbf{Q}_{\mathbf{8}}-\mathbf{H g}-$ $\mathbf{Q}_{8}$. Considering the high number of electrons calculated for the channels or voids and the variety of solvents used for crystallization, it is impossible to determine the solvent composition reliably. However, structure factors include contributions from the .fab file.

The final cif files were checked using IUCR's checkcif algorithm. Due to the characteristics of the crystals mentioned above, A-level and B-level alerts remain in the checkcif file. These alerts are inherent to the data and refinement procedures and do not reflect errors. They are explicitly listed below and have been divided into two groups.

## Group 1:

THETM01_ALERT_3_A, B The value of sine(theta_max)/wavelength is less than 0.550 or 0.575

PLAT023_ALERT_3_A, B Resolution (too) Low [sin(theta)/Lambda < 0.6]
PLAT029_ALERT_3_B _diffrn_measured_fraction_theta_full value Low
PLAT082_ALERT_2_A, B High R1 Value
PLAT084_ALERT_3_A High wR2 Value (i.e. > 0.25)
PLAT220_ALERT_2_B NonSolvent Resd 1 C Ueq(max)/Ueq(min) Range 9.0 Ratio
PLAT230_ALERT_2_B Hirshfeld Test Diff
PLAT234_ALERT_4_B Large Hirshfeld Difference
PLAT241_ALERT_2_B High 'MainMol' Ueq as Compared to Neighbors
PLAT242_ALERT_2_B Low 'MainMol' Ueq as Compared to Neighbors
PLAT340_ALERT_3_B Low Bond Precision on C-C Bonds
PLAT934_ALERT_3_B Number of (lobs-Icalc)/Sigma(W) > 10 Outliers

Group 2:
PLAT201_ALERT_2_A Isotropic non-H Atoms in Main Residue(s)
As mentioned above, not all atoms were refined with ADPs

PLAT306_ALERT_2_B Isolated Oxygen Atom (H-atoms Missing ?)
PLAT315_ALERT_2_B Singly Bonded Carbon Detected (H-atoms Missing)
As mentioned above, not all H -atoms were localized

## 5. Fluroescence anisothropy decay measurements

## Preparation of the foldamer solutions:

Dimerization of OPV-Q $\mathrm{Q}_{8}-\mathrm{H}$ was induced by adding 0.1 g of $16 \mathrm{M} \mathrm{NaOH}_{(\mathrm{aq})}$ solution into 7 mL of $\mathrm{OPV}-\mathrm{Q}_{\mathrm{n}}-\mathrm{H}$ solution in chloroform while stirring the mixture vigorously for 2 min . The heterogeneous mixture was allowed to phase separate. The foldamer solution in chloroform was withdrawn from the organic phase and placed in a fluorescence cell for absorption and fluorescence measurements.
Determination of the concentration of the foldamer species in solution: Since the deprotonated foldamers might partition between the organic and aqueous phases during the solution preparation, the foldamer concentration in chloroform was determined by UV-Vis absorption. Using the molar extinction coefficient $\varepsilon_{O P V}(450 \mathrm{~nm})$ for OPV in OPV-Q8-H at 450 nm , which had been determined to equal $32,400 \mathrm{M}^{-1} \cdot \mathrm{~cm}^{-1}$, the concentration of $\mathrm{OPV}-\mathrm{Q}_{8} \mathrm{CO}_{2} \mathrm{H}$ in chloroform was determined for each solution studied by applying Beer-Lambert law. ${ }^{\text {i }}$

Steady-State Fluorescence (SSF): All fluorescence spectra were acquired with a Horiba QM-400 spectrofluorometer equipped with a xenon arc lamp. The concentration of the OPV-Q8-H solutions ranged between 10 nM and 1 mM covering a range of 5 orders of magnitude. Depending on whether the OPV-Q8-H concentration was below or above 80 $\mu \mathrm{M}$, the fluorescence spectra were acquired with the right angle or front-face geometry, respectively, with the latter geometry being used to minimize the inner filter effect.

UV-Visible Spectrophotometer: The OPV-Q8-H solutions were placed in quartz cells of path lengths equal to $0.1 \mathrm{~mm}, 1.0 \mathrm{~mm}, 1.0 \mathrm{~cm}$, and 10.0 cm to ensure that an absorbance
around unity would be obtained for improved accuracy. All absorption spectra were acquired with a Cary 100 UV-Visible spectrophotometer

Time-Resolved Fluorescence Anisotropy (TRFA). The OPV-Q8-H solutions were excited with a 479 nm delta-diode laser fitted on a HORIBA Ultima Ultrafast timeresolved fluorometer to acquire the fluorescence decays. A 480 nm bandpass filter was placed on the excitation side, and residual stray light was blocked from reaching the detector with a 495 nm cut-off filter on the emission side. All fluorescence decays were acquired up to a peak maximum of 20,000 counts. As for the SSF spectra, the right angle and front face geometries were used to acquire the fluorescence decays depending on whether the $\mathrm{OPV}^{2} \mathrm{Q}_{8}-\mathrm{H}$ concentration was below or above $80 \mu \mathrm{M}$, respectively. The instrument response function was collected by reflecting the nano-LED light from a triangular aluminum monolith without the 495 nm cut-off filter. A time-per-channel (TPC) of $1.28 \times 10^{-2} \mathrm{~ns} /$ channel across 4,096 channels was used for all decay acquisitions. For each TRFA experiment, three fluorescence decays, namely $I_{\mathrm{Vm}}(\mathrm{t}), I_{\mathrm{Vv}}(\mathrm{t})$, and $I_{\mathrm{VH}}(\mathrm{t})$, were acquired using vertically polarized excitation light and the polarization of the emission set at the magic angle, the vertical and horizontal direction with respect to the polarization of the excitation light, respectively.

TRFA decay analysis: The $I_{\mathrm{v}}(\mathrm{t})$ and $I_{\mathrm{VH}}(\mathrm{t})$ fluorescence decays were analyzed globally with the programs aniso01d-4k and aniso01d-7k using a single rotational time. The former program optimized the OPV lifetime $\left(\tau_{0}\right)$ obtained at the magic angle, and the latter used a fixed $\tau_{0}$ value. The parameters obtained with the program yielding a better $\chi^{2}$ were selected for the plot shown in Figure 4 in the main text. The $I_{\mathrm{M}}(t)$ decay of the OPV-Q8-H solution was fitted with a monoexponential function, as shown in Equation 1, to determine the lifetime $\tau_{0}$ of the OPV label covalently attached to the foldamer. $\tau_{0}$ was found to equal $1.60( \pm 0.01)$ ns, which is typical of this compound. ${ }^{\mathrm{i}, \mathrm{ii}}$

$$
\begin{equation*}
I_{V M}(t)=I_{o} \exp \left(-t / \tau_{o}\right) \tag{1}
\end{equation*}
$$

In Equation 1, $I_{0}$ is the initial fluorescence intensity and $t$ is the time in nanoseconds. The $I_{\mathrm{Vv}}(t)$ and $I_{\mathrm{VH}}(t)$ decays were then fitted globally according to Equations 2 and 3, respectively.

$$
\begin{equation*}
I_{V V}(t)=\frac{I_{o}}{3} \exp \left(-t / \tau_{o}\right) \times[1+2 r(t)] \tag{2}
\end{equation*}
$$

$$
I_{V H}(t)=\frac{I_{o}}{3 G} \exp \left(-t / \tau_{o}\right) \times[1-r(t)]
$$

(3)

The G-factor being a scaling constant, was optimized during the analysis. Contrary to the traditional methodology involving the separate experimental determination of the Gfactor, including the G-factor in the optimization of the parameters describing $r(t)$ in Equations 2-4 has been found to be a methodology that is much more straightforward, accurate, rapid, and reliable. ${ }^{\text {i,ii }} r(t)$ can be approximated by a sum of 3 exponentials for
symmetric top macromolecules, such as OPV-Q8-H and its dimer, as shown in Equation 4. ${ }^{\text {iii }}$

$$
r(t)=r_{o} \sum_{i=1}^{n} a_{i} \exp \left(-t / \phi_{i}\right)
$$

(4)

In Equation 4, $r_{o}$ is the anisotropy at time $t$ equal zero. Global analysis of the polarized fluorescence decays $I_{\mathrm{vv}}(t)$, and $I_{\mathrm{VH}}(t)$ using a single exponential in Equation 4 yielded the average rotational time $<\phi>$ corresponding to a mixture of OPV-Q ${ }_{8}-\mathrm{H}$ and its dimer. The parameters of the fit were optimized according to the Marquardt-Levenberg algorithm.

Figure S34: Plot of the average rotational time < $\phi>$ as a function of OPV-Q8H concentration in chloroform (o) without and ( $\bullet$ ) in presence of a 16 M NaOH aqueous solution.
6. Preparation of longer metal complexes: insertion experiments by NMR and CD

$\mathrm{H}-\mathrm{Q}_{2} \mathrm{PQ}_{2}-\mathrm{H}$

Figure S 35 . ${ }^{1} \mathrm{H}$ NMR spectra of a $\mathrm{CDCl}_{3}$ solution of a) $\mathrm{H}-\mathrm{Q}_{2} \mathrm{PQ}_{2}-\mathrm{H}$ and b) $\mathrm{CO}_{2} \mathrm{H}-\mathrm{Q}_{2} \mathrm{PQ}_{2}-\mathrm{CO}_{2} \mathrm{H}$ in the presence of sodium hydroxide excess

Figure $\mathrm{S} 36 .{ }^{1} \mathrm{H} \mathrm{NMR}$ titration ( $300 \mathrm{MHz}, 298 \mathrm{~K}$ ) of a $\mathrm{CDCl}_{3}$ solution of $\mathrm{Q}_{8}-\mathrm{Na}-\mathrm{Q}_{8}$ with increasing amounts of $\mathrm{HQ}_{2} \mathrm{PQ}_{2} \mathrm{H}$ in the presence of NaOH excess a) 0.5 equiv. b) 1 equiv. c) 1.5 equiv. d) 2 equiv. e) 3 equiv. f) 0 equiv.

CD samples preparation: Samples were prepared independently by mixing $R-\mathrm{Q}_{8} \mathrm{H}$ with the corresponding amount of $\mathrm{H}-\mathrm{Q}_{2} \mathrm{PQ}_{2}-\mathrm{H}$ in dry $\mathrm{CHCl}_{3}$. Then, each sample was incubated with silver acetate excess in the dark for 24 h before measurement to ensure the complete formation of the complexes (kinetic stabilization). The initial concentration of R-Q8-H = 1 mM . A cuvettes with an optical path of 0.1 mm was used for measurements.

## 7. Experimental procedures

## Synthesis of $Q_{6}-\underline{H}$

In a 25 mL round-bottom flask, Q6-Me ${ }^{\text {iv }}$ ( $225 \mathrm{mg}, 0.15 \mathrm{mmol}$ ) is dissolved in 10 mL of THF and 2 mL of methanol. Then, finely ground $\mathrm{KOH}(42 \mathrm{mg}, 0.75 \mathrm{mmol})$ is added in one portion. The reaction is stirred overnight at room temperature. Citric acid $5 \%$ solution is added until pH ca. 5 . Then the THF is removed under reduced pressure. The residue is extracted with dichloromethane $(15 \mathrm{~mL})$ and washed with water $(15 \mathrm{~mL})$ and brine ( 15 mL ). The organic layer is dried with magnesium sulfate, and the solvent is evaporated to afford $\mathrm{Q}_{6}-\mathrm{H}$ as a yellow solid ( $150 \mathrm{mg}, 76 \%$ yield).
${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta(\mathrm{ppm}) 11.64(\mathrm{~s}, 1 \mathrm{H}), 11.60(\mathrm{~s}, 1 \mathrm{H}), 11.41(\mathrm{~s}, 1 \mathrm{H}), 11.40$ $(\mathrm{s}, 1 \mathrm{H}), 11.11(\mathrm{~s}, 1 \mathrm{H}), 8.58(\mathrm{dd}, 1 \mathrm{H}), 8.44(\mathrm{dd}, 1 \mathrm{H}), 8.40(\mathrm{dd}, 1 \mathrm{H}), 8.34(\mathrm{dd}, 1 \mathrm{H}), 8.20$ (dd, 1H), $8.14(\mathrm{dd}, 1 \mathrm{H}), 8.11(\mathrm{dd}, 1 \mathrm{H}), 8.08$ (dd, 1H), $8.05(\mathrm{dd}, 1 \mathrm{H}), 7.92(\mathrm{dd}, 1 \mathrm{H}), 7.70$ $(\mathrm{t}, 1 \mathrm{H}), 7.57-7.34(\mathrm{~m}, 7 \mathrm{H}), 7.21(\mathrm{t}, 1 \mathrm{H}), 7.20(\mathrm{~s}, 1 \mathrm{H}), 7.00(\mathrm{~s}, 1 \mathrm{H}), 6.86(\mathrm{~s}, 1 \mathrm{H}), 6.62(\mathrm{~s}$, $1 \mathrm{H}), 6.52(\mathrm{~s}, 1 \mathrm{H}), 4.42(\mathrm{dd}, 1 \mathrm{H}), 4.26-3.83(\mathrm{~m}, 11 \mathrm{H}), 2.62-2.23(\mathrm{~m}, 6 \mathrm{H}), 1.37-1.16(\mathrm{~m}$, 36H).

## Synthesis of $\mathrm{R}-\mathrm{Q}_{8}-\mathrm{H}$ or $\mathrm{S}-\mathrm{Q}_{8}-\mathrm{H}$

In a 25 mL round-bottom flask, $\mathbf{H}_{\mathbf{2}} \mathbf{N}-\mathbf{Q}_{8}-\mathbf{M e}^{\mathrm{v}}(309 \mathrm{mg}, 0.20 \mathrm{mmol})$ is dissolved in 10 mL of dry dichloromethane. Under a nitrogen atmosphere, 0.1 mL of dry diisopropylamine is added. Then at $0^{\circ} \mathrm{C},(R)$-camphanyl chloride (for R-Q8-H) or (S)-camphanyl chloride(for $\mathrm{S}-\mathrm{Q} 8-\mathrm{H})(65 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) dissolved in 5 mL of dry dichloromethane is added dropwise. The flask is stirred for 2 h . Then, the reaction is washed ( $2 \times 10 \mathrm{~mL}$ ) with water, saturated aqueous $\mathrm{NaHCO}_{3}$, citric acid $10 \%$ and brine. The organic layer is dried with magnesium sulfate and concentrated under reduced pressure. The crude is dissolved directly in 10 mL of THF and 2 mL of methanol in the presence of KOH powder ( $80 \mathrm{mg}, 1.42 \mathrm{mmol}$ ) for 18 h at room temperature. Citric acid $5 \%$ solution is added until pH reaches ca. 5 . Then the THF is removed under reduced pressure. The residue is extracted with dichloromethane $(10 \mathrm{~mL})$ and washed with water $(10 \mathrm{~mL})$ and brine $(10 \mathrm{~mL})$. The organic layer is dried with magnesium sulfate and dried under vacuum to afford after column chromatography $\mathbf{R}-\mathbf{Q}_{\mathbf{8}} \mathbf{- H}$ or $\mathbf{S}-\mathbf{Q}_{\mathbf{8}} \mathbf{- H}$ as a yellow solid ( $280 \mathrm{mg}, 95 \%$ ).

## Synthesis of $Q_{2}{ }^{\text {Hex }}-\mathrm{Me}$

In a 50 mL round-bottomed flask, $\mathbf{Q}_{1}{ }^{\mathbf{H e x}} \mathbf{- H}(2.17 \mathrm{~g}, 6.8 \mathrm{mmol})$ was dissolved in 20 mL of dry dichloromethane and stirred for an hour in the presence of oxalyl chloride $(0.86 \mathrm{~mL}$, $1.5 \mathrm{eq})$ under a nitrogen atmosphere to form the acid chloride. Then, it is dried under a high vacuum for at least three hours.

In a 100 mL round-bottomed flask, $\mathbf{H}_{2} \mathbf{N}-\mathbf{Q}^{\mathbf{H e x}}-\mathbf{M e}(1.6 \mathrm{~g}, 5.3 \mathrm{mmol})$ was dissolved in 20 mL of dry dichloromethane in the presence of 3 eq of dry diisopropylamine. Under a nitrogen atmosphere, the previously prepared acid chloride is added dropwise at $0^{\circ} \mathrm{C}$ as a solution in 10 mL of dry dichloromethane. The reaction is stirred for an hour, then is concentrated under reduced pressure, triturated in hexanes and filtered to afford $\mathbf{Q}_{2}{ }^{\mathbf{H e x}}$ Me as a dark yellow solid ( $2.9 \mathrm{~g}, 91 \%$ ) without further purification required.

## Synthesis of $\mathrm{H}_{2} \mathrm{~N}_{-} \mathrm{O}_{2}{ }^{\mathrm{Hex}}-\mathrm{Me}$

In a 100 mL round-bottom flask, $\mathbf{Q}_{2}{ }^{\text {Hex }} \mathbf{- M e}(300 \mathrm{mg}, 0.5 \mathrm{mmol})$ was dissolved in 15 mL of ethyl acetate. Palladium on carbon $(10 \%, 30 \mathrm{mg})$ was added in one portion, and the flask was stirred under a hydrogen atmosphere overnight until completion. Then the reaction is filtered over Celite and concentrated under reduced pressure without further purification to afford $290 \mathrm{mg}(99 \%)$ of the amine as a yellow solid which was used without further purification.
${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta 12.78(\mathrm{~s}, 1 \mathrm{H}), 9.10(\mathrm{dd}, 1 \mathrm{H}), 7.97(\mathrm{dd}, 1 \mathrm{H}), 7.82(\mathrm{~s}, 1 \mathrm{H})$, $7.70(\mathrm{t}, 1 \mathrm{H}), 7.62(\mathrm{~s}, 1 \mathrm{H}), 7.57(\mathrm{dd}, 1 \mathrm{H}), 7.42(\mathrm{t}, 1 \mathrm{H}), 7.05(\mathrm{dd}, 1 \mathrm{H}), 4.28(\mathrm{~d}, 2 \mathrm{H}), 4.25(\mathrm{~d}$, $2 \mathrm{H}), 4.15(\mathrm{~s}, 3 \mathrm{H}), 1.91(\mathrm{~m}, 4 \mathrm{H}), 1.64(\mathrm{~m}, 8 \mathrm{H}), 1.05(12 \mathrm{H})$

## Synthesis of $\mathrm{Me}-\mathrm{Q}_{2} \mathrm{PQ}_{2}-\mathrm{Me}$

In a 25 mL round-bottom flask $\mathbf{H}-\mathbf{P}-\mathbf{H}^{\text {vi }}$ ( $73 \mathrm{mg}, 0.23 \mathrm{mmol}$ ) is dissolved in 1 mL of dry dichloromethane. Oxalyl chloride ( 0.2 mL ) is added dropwise at $0^{\circ} \mathrm{C}$ under a nitrogen atmosphere. The reaction is stirred for one hour at room temperature until the complete formation of the acid chloride is confirmed by NMR. Solvent and excess oxalyl chloride are then evaporated under vacuum, and the solid diacid chloride is then redissolved in 5 mL of dry dichloromethane to be used in the subsequent reaction.

In a 50 mL round-bottom flask $\mathbf{H}_{2} \mathbf{N}-\mathbf{Q}_{2}{ }^{\text {Hex }}-\mathbf{M e}(290 \mathrm{mg}, 0.5 \mathrm{mmol})$ is dissolved in 10 mL of dry dichloromethane in the presence of 0.2 mL of dry diisopropylamine. Under a nitrogen atmosphere, the previously prepared diacid chloride solution is then added dropwise. The reaction is stirred for 2 h , then is concentrated under reduced pressure, filtered on a short pad of silica gel eluting with dichloromethane: ethyl acetate 9:1 and further purified by GPC to obtain $210 \mathrm{mg}(63 \%)$ of a bright yellow solid.
${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 300 \mathrm{MHz}$ ): $\delta 11.85(\mathrm{~s}, 2 \mathrm{H}), 11.66(\mathrm{~s}, 2 \mathrm{H}), 8.08(\mathrm{dd}, 2 \mathrm{H}), 7.85(\mathrm{~s}, 2 \mathrm{H})$, $7.84(\mathrm{~d}, 2 \mathrm{H}), 7.73(\mathrm{~s}, 2 \mathrm{H}), 7.72(\mathrm{dd}, 2 \mathrm{H}), 7.60(\mathrm{dd}, 2 \mathrm{H}), 7.41(\mathrm{~s}, 2 \mathrm{H}), 7.23(\mathrm{t}, 2 \mathrm{H}), 7.04(\mathrm{t}$, $2 \mathrm{H}), 4.53-4.13(\mathrm{~m}, 10 \mathrm{H}), 3.28(\mathrm{~m}, 6 \mathrm{H}), 2.00(\mathrm{~m}, 4 \mathrm{H}), 1.69(\mathrm{~m}, 16 \mathrm{H}), 1.18-1.04(\mathrm{~m}, 20 \mathrm{H})$, 0.95 ( $\mathrm{t}, 3 \mathrm{H}$ )
${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 167.8,164.9,163.4,162.8,162.2,161.3,151.7,150.2,146.2$, $138.9,138.3,133.8,133.5,127.9,127.5,122.0,121.7,116.8,116.2,116.1,115.5,111.4$, $101.6,99.5,75.4,71.5,71.1,52.2,40.9,40.8,28.1,23.7,19.2,11.3,11.2$

## Synthesis of $\mathrm{H}_{-} \mathrm{O}_{2} \mathrm{PO}_{2}-\mathrm{H}$

In a 100 mL round-bottom flask, $\mathbf{M e}-\mathbf{Q}_{2} \mathbf{P Q} \mathbf{Q}_{2}-\mathbf{M e}(50 \mathrm{mg}, 35 \mu \mathrm{~mol})$ is dissolved in 10 mL of THF and 1 mL of methanol. Then, finely ground $\mathrm{KOH}(30 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) is added. The reaction is stirred overnight at room temperature. The reaction was acidified with $5 \%$ citric acid solution and was extracted with dichloromethane. The combined organic layers were washed with water and brine, dried over magnesium sulfate and concentrated under reduced pressure to afford $43 \mathrm{mg}(88 \%)$ of a bright pale yellow solid.
${ }^{1}{ }^{H}$ NMR ( $\mathrm{CDCl}_{3}, 300 \mathrm{MHz}$ ): $\delta 11.57$ (s, 2H), 11.25 (s, 2H), $7.85(\mathrm{dd}, 2 \mathrm{H}), 7.82(\mathrm{~s}, 2 \mathrm{H})$, 7.77 (d, 2H), $7.70(\mathrm{~s}, 2 \mathrm{H}), 7.70(\mathrm{dd}, 2 \mathrm{H}), 7.61(\mathrm{~s}, 2 \mathrm{H}), 7.46(\mathrm{~s}, 2 \mathrm{H}), 7.18-7.06(\mathrm{~m}, 4 \mathrm{H})$, 4.47-4.13 (m, 10H), $1.98(\mathrm{~m}, 4 \mathrm{H}), 1.70(\mathrm{~m}, 16 \mathrm{H}), 1.16-1.02(\mathrm{~m}, 20 \mathrm{H}), 0.95(\mathrm{t}, 3 \mathrm{H})$
